Variance of the forest prediction vs number of trees
R = 300 outcome draws at fixed X; averaged over 20 test points (grey: individual points)
O'Connell Fig. 3 setup: n = 400, 12 covariates, mtry = 4, node size 5
Mentch−Zhou setup: n = 100, p = 5, bagging, node size 1, SNR = 0.05
Var(f_B(x) | X)
Number of trees (B)
Actual Var(f_B(x) | X)
Monte Carlo part (1/B) E[sigma^2_T,theta]
Theorem 1 prediction
Floor C_T
